

Safety relay modules

Selection guide: Preventa™ safety relay modules 3/2

Electrical ratings 3/12

For Emergency stop and switch monitoring

- Types XPSAC, XPSAXE 3/14
- Types XPSAV, XPSABV, XPSATE 3/18
- Type XPSATR 3/28
- Type XPSAF 3/32
- Type XPSAFL 3/36

For Emergency stop, switch or light curtain monitoring

- Type XPSAR 3/40

For Emergency stop, switch, sensing mat/edges or light curtain monitoring

- Type XPSAK 3/46

For electrical monitoring of two-hand control stations

- Types XPSBAE, XPSBCE, XPSBF 3/52

For forming a type 2 light curtain

- Types XPSCM, XU2S (single-beam photoelectric sensor) 3/60

For monitoring 2 to 4 light curtains type 2 and type 4

- Type XPSLCD 3/68

For “muting” function of type 2 and type 4 light curtains

- Type XPSLCM 3/72

For increasing the number of safety contacts

- Types XPSECME, XPSECPE 3/80

For safety time delays

- Types XPSTSA, XPSTSW 3/84

For non-contact safety interlock (coded magnetic) switch monitoring

- Types XPSDME, XPSDME 3/88

For zero speed detection

- Type XPSVNE 3/94

For dynamic monitoring of hydraulic valves on linear presses

- Type XPSPVT 3/100

For dynamic monitoring of double-bodied solenoid valves

- Type XPSPVK 3/104

For safety stop with automatic overtravel monitoring and control

- Type XPSOT 3/108

Dimensions 3/112

Safety solutions on AS-Interface™ cabling system

Selection guide: Safety monitors and interfaces 3/114

AS-Interface “Safety at work” monitors 3/116

Safety interfaces 3/120

Electrical life

The product life expressed is based on average usage and normal operating conditions. The above statements are not intended to nor shall they create any express or implied warranties as to product operation or life. For information on the limited warranty offered on this product please refer to the Square D terms and conditions of sale found in the "Square D by Schneider Electric" Digest.

Definition of tests

Determination of electrical life conforming to EN 60947-5-1 (table C2)

Type of current	Utilization category	Start-up			Breaking		
		Current	Voltage	Cos φ	Current	Voltage	Cos φ
a.c. supply	AC-15	10 x I _e	U _e	0.7	I _e	U _e	0.4
Type of current	Utilization category	Start-up			Breaking		
		Current	Voltage	T _{0.95}	Current	Voltage	T _{0.95}
d.c. supply	DC-13	I _e	U _e	50 ms	I _e	U _e	50 ms

I_e: operational current measured. U_e: operational voltage measured. Cos φ: power factor. T_{0.95}: time taken to reach 95% of nominal current.

Notes

The tests are carried out with a frequency of 6 switching operations per minute and with no additional protection of the components connected to the safety outputs.

The use of additional protection for the components connected to the safety outputs significantly increases the durability of the safety outputs.

Determination of the breaking capacity conforming to EN 60947-5-1 (table 4)

Utilization category	Start-up			Breaking			Total number of switching operations	Switching operations per minute for 1 to 1000 switching operations	Switching operations per minute for 1001 to 6050 switching operations	Minimum duration of switching operation
	Current	Voltage	Cos φ	Current	Voltage	Cos φ				
AC-15	10 x I _e	U _e	0.3	I _e	U _e	0.3	6050	60	6	50 ms
Utilization category	Start-up			Breaking			Total number of switching operations	Switching operations per minute for 1 to 1000 switching operations	Switching operations per minute for 1001 to 6050 switching operations	Minimum duration of switching operation
	Current	Voltage	T _{0.95}	Current	Voltage	T _{0.95}				
DC-13	I _e	U _e	50 ms	I _e	U _e	50 ms	6050	60	6	50 ms

I_e: operational current measured. U_e: operational voltage measured. Cos φ: power factor. T_{0.95}: time taken to reach 95% of nominal current.

Notes

The maximum values for the breaking capacity of the safety outputs in the various utilization categories are not fixed and depend on the power factor and on the switching frequency. The test definition for the "breaking capacity" and "durability" tables in the European standard EN 60947-5-1 uses different values for the power factor and the switching frequency.

The power factor (cos φ) in the "breaking capacity" table (0.3) is greater than that in the "durability" table (0.7).

In the "breaking capacity" table, the switching frequency of the safety outputs is higher for the first 1000 switching operations (60 per minute) than that for 1001 to 6050 switching operations (6 per minute).

Consequently, the maximum breaking capacity values determined using the "breaking capacity" table are lower than those in the "durability" table.

Safety relays

Preventa™ safety relay modules types XPSAC, XPSAXE

For Emergency stop and switch monitoring

Operating principle

Safety relay modules XPSAC and XPSAXE are used for monitoring Emergency stop circuits conforming to standards EN/ISO 13850 and EN/IEC 60204-1 and also meet the requirements for the electrical monitoring of switches in protection devices conforming to standard EN 1088/ISO 14119. They provide protection for both the machine operator and the machine by immediately stopping the dangerous movement on receipt of a stop instruction from the operator, or on detection of an anomaly in the safety circuit itself.

To aid diagnostics, the modules have LEDs which provide information on the monitoring circuit status.

The XPSAC module has 3 safety outputs and a solid-state output for signaling to the PLC.
The XPSAXE module has 3 safety outputs and a relay output for signaling to the PLC.

(1) Only for Emergency stop button with 2 N.C. contacts.

LED details

1 Supply voltage A1-A2.
2 K1-K2 status (N.O. safety outputs closed).

Safety relays

Preventa™ safety relay modules
types XPSAV, XPSABV, XPSATE
For Emergency stop and switch monitoring

Operating principle

Safety relay modules XPSAV, XPSABV and XPSATE are used for monitoring Emergency stop circuits conforming to standards EN/ISO 13850 and EN/IEC 60204-1 and also meet the requirements for the electrical monitoring of switches in protection devices conforming to standard EN 1088 / ISO 14119.

They provide protection for both the machine operator and the machine by immediately stopping the dangerous movement on receipt of a stop instruction from the operator, or on detection of an anomaly in the safety circuit itself.

In addition to the stop category 0 instantaneous opening safety outputs (3 for XPSAV, 2 for XPSABV and 2 for XPSATE), the modules incorporate stop category 1 time delay outputs (3 for XPSAV, 1 for XPSABV and 3 for XPSATE) which allow for controlled deceleration of the motor components until a complete stop is achieved (for example, motor braking by variable speed drive).

At the end of the preset delay, the supply is disconnected by opening the time delay output circuits.

For module XPSAV, the time delay of the 3 output circuits is adjustable, in 15 preset values, between 0 and 300 seconds using selector buttons.

For module XPSABV, the time delay of the output circuit is adjustable between 0.15 and 3 seconds or 1.5 and 30 seconds, depending on the model, using a selector switch.

For module XPSATE, the time delay of the 3 output circuits is adjustable between 0 and 30 seconds using a 12-position selector switch.

Module XPSAV also incorporates 3 solid-state signaling outputs for signaling to the process PLC.

Module XPSATE incorporates 4 solid-state signaling outputs for signaling to the process PLC.

To aid diagnostics, the modules have LEDs which provide information on the monitoring circuit status.

The Start button monitoring function is configurable depending on the wiring.

XPSAV

Module XPSAV associated with an Emergency stop button with 1 N.C. contact, automatic start or unmonitored start

- (1) Link for automatic start.
 - (2) Instantaneous opening safety outputs (stop category 0).
 - (3) Time delay opening safety outputs (stop category 1).
- ESC = External start conditions.

Functional diagrams

Automatic start

There is no start contact or it is jumpered (wiring between terminals S13 - S14).

Note: Automatic start function is not available on the XPSAV with 2 channel wiring on the inputs. Automatic start function is only available on single channel wiring on the inputs.

Unmonitored start

The output is activated on closing of the start contact.

Monitored start

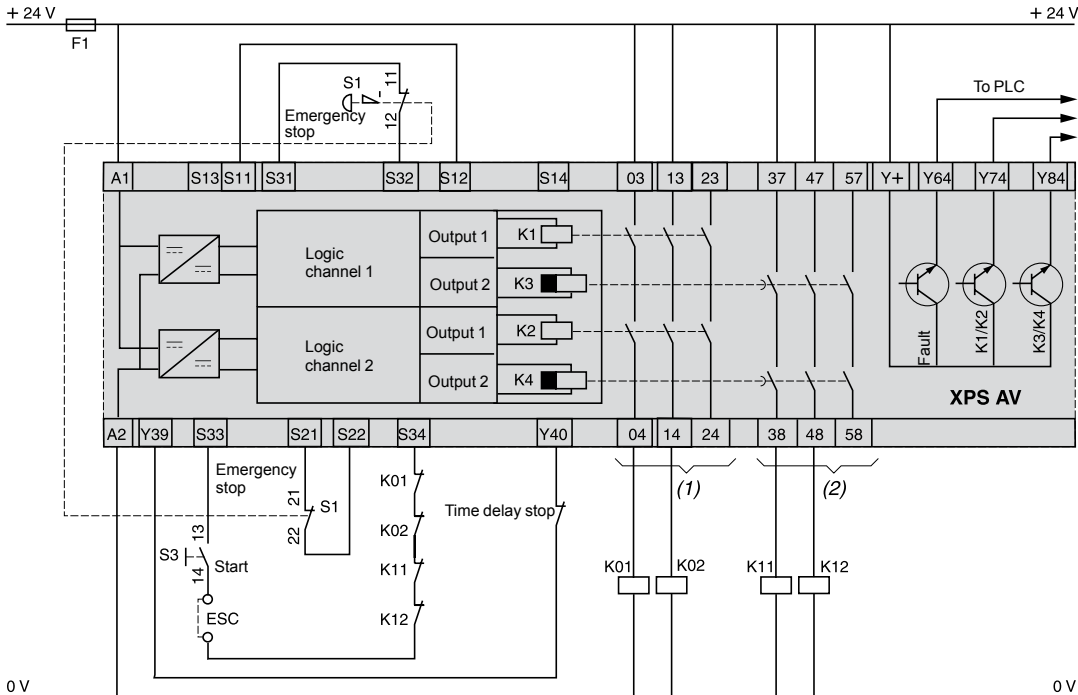

The start input is monitored so that there is no start-up in the event of the start contact being jumpered or the start circuit being closed for more than 10 seconds. Start-up is triggered following activation of the start button (push-release function) on opening of the contact (wiring between terminals S33-S34).

Safety relays

Safety relays

Preventa™ safety relay modules type XPSATE
For Emergency stop and switch monitoring

3

XPSATE
Module XPSATE associated with an Emergency stop button*

S1: Emergency stop button with 2 N.C. contacts (recommended application).

S2: Start button.

ESC: External start conditions.

Y1 (S33) - Y2: Feedback loop.

F1: 4 A max.

(1) With start button monitoring.

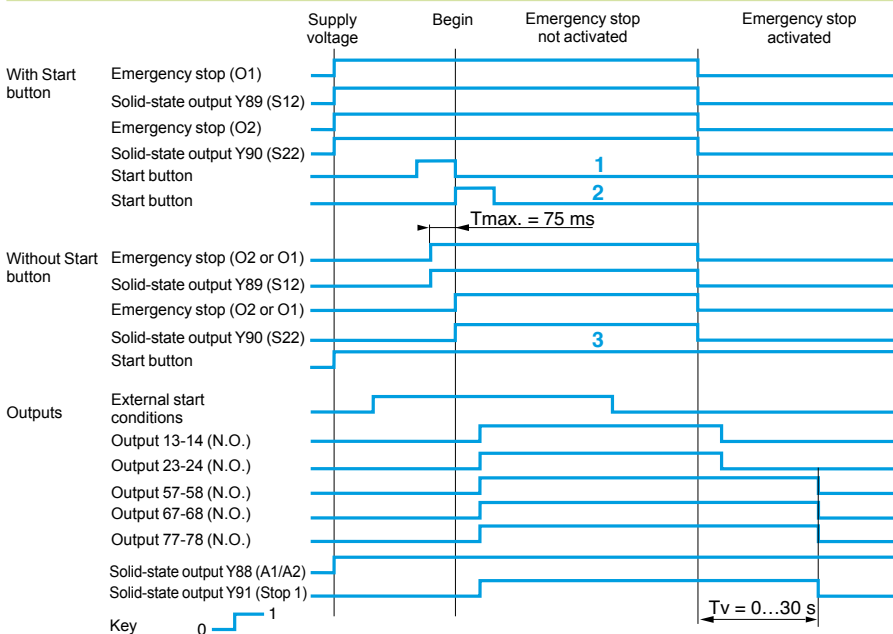

(2) Without start button monitoring.

(3) The outputs must be fuse protected. Technical specifications for maximum rating of fuses, see page 3/18.

(4) ~ 115/230 V only.

*For automatic start, jumper S2 (N.O. start button between terminals S33-Y1). This is only feasible when configured without start button monitoring (Y3 and Y4 jumpered). If S2 is jumpered and the module is configured for start button monitoring (Y3 and Y5 jumpered), the N.O. safety contacts will not close.

Functional diagram of module XPSATE with Emergency stop button monitoring

1 With start button monitoring (Y3-Y5 connection).

2 Without start button monitoring (Y3-Y4 connection).

3 Without start button (connection Y3-Y4 and S33-Y1).

Tv: adjustable time.

LED details

1 1Supply voltage A1-A2, internal electronic fuse status.

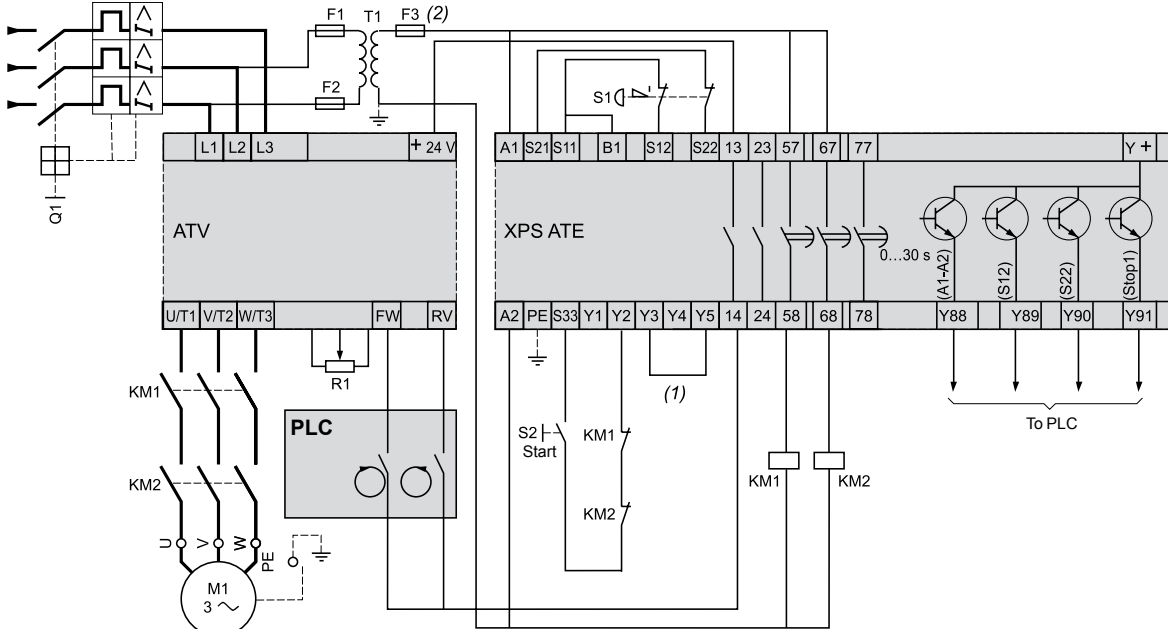

2 S12 (A) input status.

3 S22 (B) input status.

4 Stop category 1 outputs closed.

XPSATE

Example of a circuit combining an Emergency stop module with a variable speed drive

- S1: Emergency stop button with 2 N.C. contacts (recommended application).
- S2: Start button
- (1) With start button monitoring.
- (2) Technical specifications for establishing maximum rating of fuses, see page 3/18.

Connection with 1 Emergency stop button

Both input channels are supplied at the same potential.
S1: Emergency stop button with 2 N.C. contacts
A short-circuit between the 2 inputs is not detected.

Connection with multiple Emergency stop buttons

The 2 input channels are supplied at different potentials.
A short-circuit between the 2 inputs is detected.

Configuration with start button monitoring
(functional diagram for Start button 1, see page 3/21)

(1) Auxiliary terminal (to be used to separate the feedback loop from the wiring to the start button).

Monitoring an Emergency stop button with 1 N.C. contact

S1: Emergency stop button with 1 N.C. contact.
Not all faults are detected: a short-circuit on the Emergency stop pushbutton is not detected.

Configuration without start button monitoring
(functional diagram for Start button 2, see page 3/21)

(1) Auxiliary terminal (to be used to separate the feedback loop from the wiring to the start button).

Safety relays

Preventa™ safety relay modules type XPSATR
For Emergency stop and switch monitoring

Operating principle

Safety relay modules XPSATR meet the requirements of Performance Level PL e/ Category 4 conforming to standard EN ISO 13849-1.

Safety relay modules XPSATR are electronic, redundant and self-monitoring devices with positively driven relays.

They are used for monitoring Emergency stop circuits (single or two-channel) and protective guarding applications.
The modules conform to standards EN/ISO 13850 and EN 60204-1.

They provide protection for both the machine operator and the machine by immediately stopping the hazardous movement on receipt of a stop instruction from the operator or guarding switches, or on detection of an anomaly in the safety circuit itself. XPSATR incorporates 3 N.O. and 1 N.C. instantaneous contacts and 3 time-delayed N.O. contacts.

To aid diagnostics, the modules have 5 LEDs on the front face which provide information on the monitoring circuit status.

Operating principle

Safety relay modules XPSAF are used for:

- Monitoring Emergency stop circuits conforming to standards EN/ISO 13850 and EN/IEC 60204-1.
- Electrical monitoring of switches activated by protection devices conforming to standard EN 1088/ISO 14119.

Housed in a compact enclosure, the modules have 3 safety outputs.

Preventa™ safety relay modules XPSAF●●●●P incorporate removable terminal blocks, thus optimizing machine maintenance.

To aid diagnostics, the modules have 3 LEDs on the front cover which provide information on the monitoring circuit status.

The Start button monitoring function is configurable depending on the wiring.

Operating principle

Safety relay modules XPSAR are designed for the following safety applications:

- Monitoring Emergency stop circuits conforming to EN/ISO 13850 and EN/IEC 60204-1.
- Electrical monitoring of switches activated by protection devices conforming to standard EN 1088/ISO 14119.
- Monitoring type 4 light curtains conforming to EN/IEC 61496-1 which have solid-state safety outputs with test function, for example, light curtains type XUSL.

In addition to 7 safety outputs, modules XPSAR incorporate 2 relay signalling outputs and 4 solid-state signalling outputs for signalling to the process PLC.

Safety modules XPSAR●●●●●P incorporate removable terminal blocks, thus optimizing machine maintenance. To aid diagnostics, the modules have 4 LEDs on the front cover which provide information on the monitoring circuit status. The Start button monitoring function is configurable depending on the wiring.

Operating principle

Safety relay modules XPSAK are used for:

- Monitoring Emergency stop circuits conforming to standards EN/ISO 13850 and EN/IEC 60204-1.
- Electrical monitoring of switches activated by protection devices, with optional selection of synchronization time between signals.
- Monitoring 4-wire sensing mats or edges.
- Monitoring type 4 light curtains conforming to EN/IEC 61496-1 which have solid-state safety outputs with test function, for example, light curtains type XUSL.

Housed in a compact enclosure, the modules have 3 safety outputs, a relay signalling output and 4 solid-state signalling outputs for signalling to the process PLC.

Preventa™ safety relay modules XPSAK●●●●P incorporate removable terminal blocks, thus optimizing machine maintenance.

To aid diagnostics, the modules have 4 LEDs on the front cover which provide information on the monitoring circuit status.

The Start button monitoring function is configurable depending on the wiring.

Safety relays

Preventa™ safety relay modules type XPSAK

For Emergency stop, switch, sensing mat/edges or light curtain monitoring

XPSAK

Emergency stop monitoring function configuration

1-channel wiring

Emergency stop button with a single N.C. contact

Not all anomalies are detected: a short-circuit on the Emergency stop push button is not detected.

2-channel wiring

Emergency stop button with 2 N.C. contacts, without short-circuit detection

Emergency stop button with 2 N.C. contacts, with short-circuit detection (recommended application)

The 2 input channels are supplied at different potentials. A short-circuit between the 2 inputs is detected.

3

Connection of multiple Emergency stop buttons with 2 N.C. contacts (recommended application).

The 2 input channels are supplied at different potentials. A short-circuit between the 2 inputs is detected.

Start configurations

Automatic start

With start button monitoring

Proximity sensor monitoring

Proximity sensors with PNP outputs
Without short-circuit detection

Proximity sensors with NPN and PNP outputs
With short-circuit detection

Sensing mat or edges monitoring

Safety relays

Preventa™ safety relay modules type XPSAK
 For Emergency stop, switch, sensing mat/edges or light curtain monitoring

XPSAK

Monitoring of a movable guard associated with 2 switches with 1 contact each in combined mode (switch 1 with N.O. contact, switch 2 with N.C. contact)
 Automatic start, without synchronization time monitoring Manual start by Start button

Monitoring of a movable guard associated with 2 switches and automatic start (shown with guard open)

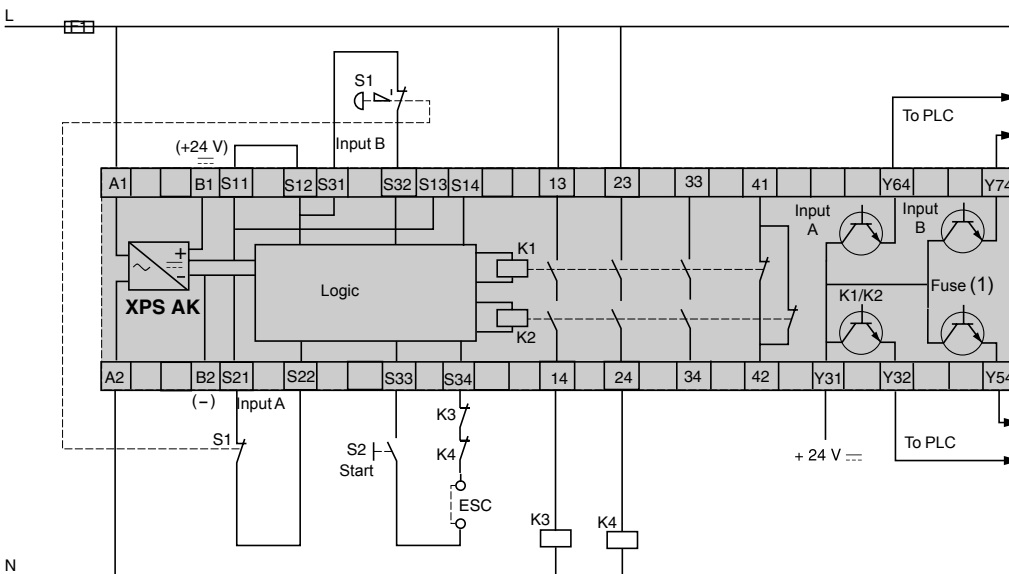

For synchronization monitoring of the inputs, S13 and S14 must be wired per the diagram to the left (if S13 and S14 are jumpered, the result would be automatic start without synchronization monitoring). The synchronization time is determined by the first limit switch that is activated.
 If S1 is actuated before S2, then the synchronization time is two seconds on closing.
 If S2 is actuated before S1, then the synchronization time is four seconds on closing.
 There is no synchronization on opening the door or guard.

Functional diagram of outputs

Module XPSAK associated with an Emergency stop button with 2 N.C. contacts

Supply connection according to voltage: ~ across terminals A1/A2, or --- 24 V across terminals B1/B2.

Safety relays

Preventa™ safety relay modules types XPSBAE, XPSBCE, XPSBF

For electrical monitoring of two-hand control stations

Operating principle

Two-hand control stations are designed to provide protection against hand injury. They require machine operators to keep their hands clear of the hazardous movement zone.

The use of two-hand control is an individual protective measure, which can protect only one operator. Separate two-hand control stations must be provided for each operator in a multiple-worker environment.

Safety relay modules XPSBAE, XPSBCE and XPSBF for two-hand control stations comply with the requirements of European standard EN 574/ISO 13851 for two-hand control systems.

The control stations must be designed and installed such that they cannot be activated involuntarily or easily rendered inoperative. Depending on the application, the requirements of type C standards specific to the machinery involved must be met (additional personal protection methods may have to be considered).

To initiate a hazardous movement, both operators (two-hand control pushbuttons) must be activated within an interval ≤ 0.5 s (synchronous activation). If one of the two pushbuttons is released during a hazardous operation, the control sequence is cancelled. Resumption of the hazardous operation is possible only if both pushbuttons are returned to their initial position and reactivated within the required time interval.

The control sequence does not occur if:

- Both two-hand control push buttons are pressed during a time period greater than 0.5 seconds,
- A short-circuit is present in a push button contact,
- The feedback loop is not closed at start-up.

The safety distance between the control units and the hazardous zone must be sufficient that when only one operator is released, the hazardous zone cannot be reached before the hazardous movement has been completed or stopped.

XPSBAE

This module is designed for use on lighter duty applications where a two-hand control function is desired, but where the Performance Level required (PLr) is PLa, b, or c and the two-hand control requirements meet Type III A (per EN 574/ISO 13851). **This module is not to be used for applications, such as presses, which require a Type III C module or where the application is not PLa, b, or c.** For press applications, for applications in PLd or e, or if application calls for a Type III C module, use XPSBCE or XPSBF module.

XPSBCE and XPSBF

These modules can be used on applications, such as presses, which require a Type III C module. The XPSBCE and XPSBF can be used for a two-hand control application, including presses and similar equipment.

- 1 Supply voltage A1-A2 (fuse status).
- 2 Fault signalling.
- 3 K1-K2 status (N.O. safety outputs closed).

Safety relays

Preventa™ safety relay modules type XPSCM and single-beam photoelectric sensors type XU2S

With a test input associated with a built-in “muting” function

Operating principle

XPSCM safety relay modules, when combined with XU2S single-beam photoelectric sensors (periodically tested), form a category 2 light curtain conforming to standards IEC/EN 61496 parts 1 and 2 and EN 60825-1.

The connection of 1–4 pairs of XU2S photoelectric sensors makes it possible to create a protected space up to 47.2 in. (1200 mm) high, conforming to EN 999/ISO 13855, and 26.2 ft (8 m) long.

The built-in “muting” function allows the automatic passage of parts for machining or loaded pallets, without interrupting the transportation movement within the zone protected by the electro-sensitive protection equipment (ESPE).

When the system is switched on by the start command, and the light protection is not interrupted, the main circuit is closed by the two safety relays of the XPSCM module.

An interruption of the protection field causes the safety outputs to open instantaneously, and the process PLC receives a stop command. The LED on the XPSCM front panel changes from green to red. The Open state is maintained until the module is restarted using the start button.

The “muting” function allows the light protection to be inhibited (muted). This function allows a trolley transporting materials to pass through without triggering the main circuit. The Muting function cannot be activated by energizing the inhibition devices unless the safety outputs have been switched on beforehand.

To trigger the “muting” function, the inhibition devices (muting sensors) must be activated within the 3-second interval. This synchronization time for the two inhibition inputs can be deactivated by connecting two configuration terminals. The muting cycle has a maximum duration of 60 seconds. During this period, materials can be transported through the protection field without deactivating the safety outputs. The 60 second limit value of the muting cycle may be made infinite by connecting two configuration terminals.

During the muting operation process, a light indicating the muting state is controlled by the XPSCM module. The indicator light comes on when a muting signal is generated, and indicates the inhibition of the protection function. An indicator light error (short-circuit, open-circuit) will be recognized, and will deactivate the Muting function.

D1, D2, D3, D4: monitoring photoelectric sensors

MA1, MB1, MA2, MB2: muting photoelectric sensors

m = trolley length

dM = distance between MA1/MB1 and MA2/MB2

Conditions to be observed for the “muting” function

- “Muting” sensors must be of the XU2 M18PP340 thru-beam or XU9 M18PP340 polarized reflex type, or mechanical limit switches with contacts.
- $dM \leq m$ to obtain continuous validation of the “muting” function.
- Avoid the intrusion of persons during the muting phase. This phase is indicated by an indicator light connected to the muting indicator output of the XPSCM module.
- A materials transportation trolley (i.e.: AGV) must generate the muting signal before it enters the protection field, and discontinue the muting signal on exiting once it has cleared all the sensors of the protection field.

Safety relays

Preventa™ safety relay modules type XPSCM and single-beam photoelectric sensors type XU2S
With a test input associated with a built-in “muting” function

Specifications of safety modules			
Module type		XPSCM1144	XPSCM1144P
Maximum achievable safety level (1)		PL c/Category 2 conforming to EN/ISO 13849-1, SILCL 1 conforming to EN/IEC 62061	
Reliability data	Mean Time To dangerous failure (MTTF _d)	Years	16.6
	Diagnostic Coverage (DC)	%	95.5
	Probability of dangerous Failure per Hour (PFH _d)	1/h	3.12 x 10 ⁻⁷
Conformity to standards		EN/IEC 61496-1, EN/IEC 61496-2, EN/IEC 60204-1, EN/IEC 60947-1, EN/IEC 60947-5-1,	
Product certifications		UL, CSA, IFA	
Ambient air temperature		°F (°C)	Operation: +14 to +131 (-10 to +55). Storage: -13 to +185 (-25 to +85)
Degree of protection conforming to IEC 529		Terminals: IP 20, enclosure: IP 40	
Supply voltage		V	--- 24, voltage limits: ±20%
Maximum power consumption		W	< 15, with thru-beam photoelectric sensors and muting signaling
Module fuse protection		Internal, electronic	
Rated insulation voltage (U_i)		V	300 (degree of pollution 2 conforming to EN/IEC 60947-5-1, DIN VDE 0110 parts 1 and 2)
Rated impulse withstand voltage (U_{imp})		kV	4 (overvoltage category 3, conforming to EN/IEC 60947-5-1, DIN VDE 0110 parts 1 and 2)
Inputs for sensors	Number of inputs to be monitored	4 (terminals Z1, Z2, Z3, Z4)	
	Input voltage	V	--- 24
	Supply voltage of sensors	V	--- 24 (terminal U+/U-)
	Supply current of sensors	mA	< 200
Inputs for the Muting function	Number of muting inputs	2 (terminals MA, MB)	
	Input voltage	V	--- 24 (terminal U+/U-)
	Maximum current	mA	< 200
	Synchronization time for the activation of the MA/MB muting signal	s	3 (±20%) for activation of the MA/MB “muting” signal
	Muting maximum duration	s	60 (-10 to +30%)
Single-beam thru-beam photoelectric sensors for input monitoring Z1-Z2-Z3-Z4			
-sensors authorized for the protection field (max. 4)		XU2S18PP340●●● (infrared)	
-muting sensors		XU2 M18PP340●●● or XU9 M18PP340●●● photoelectric sensors or XC limit switches	
-sensor supply resistivity		Ω	10 max.
Safety outputs			
-number and type		2 N.O. (terminals 13-14, 23-24), hard contacts	
-solid-state output breaking capacity		4 N.O. 24 V/20 mA, (Y33-Y34, Y33-Y44, Y33-Y54, Y33-Y64)	
-breaking capacity in AC-15		VA	C300: inrush 1800, maintained 180
-breaking capacity in DC-13		24 V/1.5 A, L/R = 50 ms	
-maximum thermal current (I _{the})		A	5.6
-sum of maximum thermal current		A	11
-minimum current (volt-free contact)		mA	10
-minimum voltage (volt-free contact)		V	17
-short-circuit protection		A	4 gG or 6 fast-acting fuse cartridge, conforming to EN/IEC 60947-5-1 and DIN VDE 0660 part 200
Muting signaling sensors for incandescent lamp		Number 1 (terminal H1), maximum power: 6.5 W/--- 24 V, minimum power: 4 W/--- 24 V	
Response time on input change of state		ms	< 25
Electrical life		See page 3/12.	
Display		4 LEDs	
Connection		Type	
1-wire connection	Without cable ends	Captive screw clamp terminals	Captive screw clamp terminals, separate, removable terminal block
	With cable ends, without bezel	Solid or flexible cable: 26-14 AWG (0.14 – 2.5 mm ²)	Solid or flexible cable: 24-14 AWG (0.2 – 2.5 mm ²)
		Flexible cable: 24-14 AWG (0.25 – 2.5 mm ²)	Flexible cable: 24-14 AWG (0.25 – 2.5 mm ²)
With cable ends, with bezel	Flexible cable: 24-16 AWG (0.25 – 1.5 mm ²)	Flexible cable: 24-14 AWG (0.25 – 2.5 mm ²)	
2-wire connection	Without cable ends	Solid or flexible cable: 26-18 AWG (0.14 – 0.75 mm ²)	Solid cable: 24-18 AWG (0.2 – 1.0 mm ²), Flexible cable: 24-16 AWG (0.2 – 1.5 mm ²)
	With cable ends, without bezel	Flexible cable: 24-18 AWG (0.25 – 1.0 mm ²)	Flexible cable: 24-18 AWG (0.25 – 1.0 mm ²)
	With cable ends, double with bezel	Flexible cable: 22-14 AWG (0.5 – 1.5 mm ²)	Flexible cable: 22-14 AWG (0.5 – 1.5 mm ²)

Operating principle

The safety monitoring module XPSLCD1141 enables independent monitoring of 2 to 4 light curtains type 2 and type 4.

Each output of the light curtain is separately connected to the inputs of the safety monitoring module, which either authorises or prevents activation of its two safety outputs.

The module manages starting and EMD/MPCE functions and therefore, the light curtains connected to it must be configured for automatic start and the EDM/MPCE function deactivated. The safety monitoring module XPSLCD1141 provides the supply and also manages, in addition to its own auxiliary outputs (1 PNP and 1 NPN), the auxiliary outputs of the light curtains.

At the slightest intrusion through one or more light beams of any of the light curtains, the outputs of the safety monitoring module open. This also applies in the event of any internal fault or output relay(s) fault (subject to the EDM/MPCE configuration on the module).

The light curtain system conforms to the standard EN/IEC 61496-1 (type 4).

The Preventa™ safety monitoring module XPSLCD1141 incorporates removable terminal blocks, thus optimizing machine maintenance.

To aid diagnostics, the safety monitoring module has 9 LEDs and a 2-digit display on the front cover which provide information on the monitoring circuit status.

Environmental specifications

Safety monitoring module type		XPSLCD1141
Maximum achievable safety level (1)		PL e/Category 4 conforming to EN/ISO 13849-1, SILCL 3 conforming to EN/IEC 62061

Safety relays

Preventa™ safety monitoring module XPSLCM For “muting” function of type 2 and type 4 light curtains

Operating principle

Safety monitoring modules XPSLCM are used with type 4 light curtains conforming to EN/IEC 61496-1 to provide a system inhibiting the light curtain protection, i.e. “muting”. This function enables the automatic passage of parts for machining or loaded pallets, without interrupting the transportation movement within the zone protected by the electro-sensitive protection equipment (ESPE) system. In addition to the electro-sensitive protection and safety relay modules XPSLCM, the system consists of 4 to 8 inhibition sensors, 2 indicator lights and a key switch to reset the system to the initial state in the event of a sequence error.

When the system is switched on by the start command and the light curtain protection not interrupted, the main circuit is closed by the safety outputs of the XPSLCM modules (solid-state safety outputs). In addition to safety outputs, the modules incorporate signalling outputs for sending system status information to the PLC. Either 5 or 14 LEDs and a 2-digit display, mounted on the front cover of the module, provide information on the safety circuit status.

An interruption of the protection field monitored by the electro-sensitive protection equipment causes instantaneous opening of the safety outputs; the process PLC receives a stop command and the LED display mounted on the front cover indicates the change of state of the safety circuits. The “open” state is maintained until the module is restarted using the Start button.

The “muting” function cannot be activated by supplying the inhibition sensors unless the safety outputs have been switched on beforehand. To trigger the “muting” function, the inhibition devices must be activated within the 3 second time interval. During the activated “muting” phase, materials can be transported through the protection field without deactivating the safety outputs. In the event of intrusion into the hazardous zone, a person cannot activate the inhibition sensors in the same way and the system stops.

During the muting operation process, a light indicating the muting state is controlled by the XPSLCM module. The indicator light comes on when a muting signal is generated, and indicates the inhibition of the protection function. An indicator light error (short-circuit, open-circuit) will be recognized, and will deactivate the Muting function.

ESPE: electro-sensitive protection equipment (light curtain).

A, B, D, C: “muting” sensors.

m: trolley length and dM = distance between A, B and D, C.

Conditions to be observed for the “muting” function

- The “muting” sensors must either be thru-beam type XUB 0BPSNL2 + XUB 0BKSNL2T, polarized reflex type XUB 0BPSNL2 + XUC Z50 or mechanical limit switches with contacts.
- $dM \leq m$ to obtain continuous validation of the “muting” function.
- Avoid the intrusion of persons during the “muting” phase. This phase is indicated by the indicator light connected to the “muting” indicator output of the XPSLCM module.
- A materials trolley must provide the “muting” signal before entering the protection field and cease it once it has cleared all the sensors of the protection field on exiting.

Operating principle

Safety relay modules XPSTSA and XPSTSW are used in applications requiring safety time delays:

- modules XPSTSA in applications with interlocking on high inertia machines with long rundown time (guards unlocked after safety time delay has elapsed),
- modules XPSTSW in applications with a safety switchover contact (jumping contact in association with XPSVN modules for zero speed detection, solenoid valve monitoring, etc.).

The time delay of safety circuits can be set to 16 preset values, using 2 selectors located on the front cover of the modules.

To aid diagnostics, the modules have LEDs which provide information on the monitoring circuit status and 2 solid-state outputs for signalling to the process PLC.

In addition, their removable terminal blocks optimize machine maintenance.

Safety relays

Preventa™ safety relay modules types XPSDMB, XPSDME

For non-contact safety interlock (coded magnetic)
switch monitoring

Operating principle

Safety relay modules XPSDMB and XPSDME are specifically designed for monitoring coded magnetic safety switches. They incorporate two safety outputs and two solid-state outputs for signalling to the process PLC.
XPSDMB safety relay modules can monitor two independent sensors and modules XPSDME can monitor up to six independent sensors.
To monitor a higher number of magnetic switches using these safety modules, the magnetic switches can be connected in series, while meeting the requirements of category 3 of EN/ISO 13849-1.

Safety modules XPSDM●●●●●P incorporate removable terminal blocks, thus optimizing machine maintenance.

To aid diagnostics, the modules have LEDs on the front cover which provide information on the monitoring circuit status.

Safety relays

Preventa™ safety relay modules type XPSVNE

For zero speed detection

Operating principle

Preventa™ safety relay modules type XPSVNE for zero speed detection are used to detect the stop condition of electric motors. Their most common applications include: providing the unlock signal for electrically interlocked sliding or removable machine guards, controlling rotation direction signals for reversing motors and engaging locking brakes after a motor has come to a standstill.

As electric motors run down, a remanent voltage is produced in the windings of the motor due to residual magnetism. This voltage is proportional to the speed of the motor and, therefore, decreases as the motor comes to a standstill. This remanent voltage is measured in a redundant manner so as to detect the stop condition of the motor. The cabling between the motor windings and the inputs of the XPSVNE module is also monitored to prevent a cabling breakage or anomaly being seen as a stopped motor.

A transformer should not be used to connect the motor to terminals Z1, Z2 and Z3 since there is no monitoring of the connection with the motor winding via the resistance monitoring.

Modules XPSVNE are suitable for detecting the stop condition of all types of a.c. or d.c. motor driven machines which, when the motor runs down, produce a remanent voltage in the windings due to residual magnetism. These machines can be controlled by electronic devices, such as variable speed drives or d.c. injection brakes.

The input filters for standard XPSVNE modules are designed for a frequency of up to 60 Hz.

For motors operating at a frequency higher than 60 Hz, which therefore produce a high frequency remanent voltage, special modules XPSVNE●●●●HS should be used.

The XPSVNE is not compatible with Wound Rotor Motors. These motors are typically used in high HP (1000+) low speed applications, where the additional windings (required for these types of motors) pay for themselves. If power is removed from stator, but rotor is left energized, then transformer coupling between the two could create a small voltage across the stator. This could make the XPSVNE think the motor is still turning, which means the safety outputs would never energize or change state. These motors do not have residual magnetism in the rotor that can act as a source of flux for generator effect, in which case the XPSVNE may think the motor is at zero speed, and could energize the safety outputs while the motor is still running. Wound Rotor motors are not in common use today, and very rare.

The XPSVNE is not designed for use with single phase motors.

The XPSVNE is not designed to detect locked rotor conditions. Here the motor still has voltage applied to it, but in essence has zero speed. Generally, a locked rotor condition is not a safe state for machinery nor the operators. The XPSVN will sense voltage applied to the windings, and will not indicate the motor's "apparent" zero speed. The outputs of the XPSVN will not change state, the gates or guards will not be unlocked, and operators will not be allowed access to the unsafe area.

Modules XPSVNE have 2 potentiometers mounted on the front cover of the module which allow independent adjustment of the switching threshold for each input circuit. This allows adjustment for different types of motors and application requirements.

To aid diagnostics, modules XPSVNE have 4 LEDs and 2 solid-state outputs to provide information on the status of the zero speed detection circuit.

Safety relays

Preventa™ safety relay modules type XPSPVT For dynamic monitoring of hydraulic valves on linear presses

3

Operating principle

Safety relay module XPSPVT is specifically designed for monitoring hydraulic safety system valves which control the movements of potentially hazardous machines. The operating principle of this module is explained in the circuit diagram of a hydraulic safety system for linear presses (see below).

This hydraulic safety system features a 3 position piston which controls the up and down stroke of the operating cylinder. The circuit is equipped with a safety valve, to complete the redundant system. This circuit must be activated to enable the up and down stroke of the cylinder.

If either of the 2 pistons becomes defective (for example, due to a broken spring or to oil contamination), and the valve piston shifts from its normal position towards the open position, the XPSPVT module will detect it and prevent resumption of the piston stroke.

Proximity sensors integrated in the valve to detect the piston positions and connected to the XPSPVT module must be damped when the valve coils are in the de-energized state (zero position).

The sensor circuits of the XPSPVT module are designed to allow connection of NPN and PNP proximity sensors or sensing components. Either 2-wire or 3-wire types can be used.

The wiring diagram on page 3/102 shows how to connect proximity sensors.

Operating principle

Safety relay module XPSPVK is specially designed for dynamic monitoring of the safety valves in eccentric presses, conforming to European standard EN 692.

This standard establishes the specifications related to safety control systems for presses equipped with friction clutches.

To meet the requirements of this standard, the clutch/brake control must be monitored dynamically.

This function is provided by a double-bodied solenoid valve (safety valve for presses) which performs the functions of two valves mounted in one body.

The position of the two valve pistons can be monitored by proximity sensors, mechanical limit switches or pressure switches.

Module XPSPVK checks for the correct operation of the double-bodied safety valves at 3 points in the cycle.

- Start at top dead center: checks the rest position of the two valves.

- Take-on point (transfer function): checks that the two valves are in the “activated” (energized) position.

- Press stop trigger point: checks that the two valves return to the rest position. Return must be simultaneous for both valves within a defined time period.

To set up an automatic disconnect of the XPSPVK module at the first machine stroke, a N.C. auxiliary contact mounted on the main control contactor or on another contactor/relay, activated at the same time, can be wired to terminals 7 and 8 in parallel with the RESET button.

If an anomaly is detected during the cycle, the XPSPVK module will stop the slide stroke and will also inhibit the start of another cycle.

Safety relays

Preventa™ safety relay modules type XPSOT

For safety stop with automatic overtravel monitoring and control

Operating principle

Safety relay module XPSOT is used on eccentric presses to monitor overtravel and ensure that the press slide stops in a non-hazardous position, that is, top dead center (TDC) during normal (non-emergency) operation. Use of this module, designed in accordance with standard EN 692 relating to mechanical press safety, makes it possible to create a redundant, self-monitoring control system.

The two essential functions of this safety module are to:

■ **Trigger the end of cycle stop sequences slightly before top dead center (at point A) so as to come to complete stop at TDC.**

After TDC, the permissible overtravel is approximately 10°. The safety module immediately detects any overtravel. Overtravel is indicative of braking device deterioration and, in this case, jog mode must be used to move the slide back to TDC. The next cycle will be inhibited to allow maintenance to be performed on the braking device (cam 1).

■ **Take over control monitoring during the dangerous part of the cycle (slide downstroke). Any stop instruction issued between TDC (0°) and point C (approximately 150° after TDC) causes an immediate stop of the press. This approximate value of 150° corresponds to the 0.315" (8mm) tool closure dimension (safety point).**

When a stop instruction is issued after this safety point, the press completes the cycle and comes to a complete stop at TDC (cam 2).

Control of the hazardous part of the cycle (generally the slide downstroke) is usually activated from a two-hand control station associated with a safety module (type XPSBC) monitoring this station to qualify as a category 4 control system according to standard EN 954-1/ISO 13849-1.

Overtravel monitoring is performed **on each cycle** by safety module XPSOT.

Operating principle (continued)

Press diagram

Control cams diagram

- 1 Permissible overtravel zone.
- 2 Dangerous zone (usually slide downstroke).
- 3 Non-dangerous zone (usually slide upstroke).

S Permissible overtravel.

A Stop instruction trip point.

B Point at which permissible overtravel is exceeded (a stop instruction issued after point B will lock up the press).

C Takeover point, beyond which the press will complete its cycle up to TDC.

TDC Top dead center, actual stopping zone of the press.

BDC Bottom dead center.

Cam operation

Cam 1 is associated with the OTS limit switch (LS), cam 2 with the UN limit switch (the limit switches must be located on different cams for safety reasons).

The OTS limit switch is deactivated at TDC, at which point the UN limit switch is activated.

Point A1 of cam 1 is located approximately 300° after TDC and, when reached, the press stops and comes to a standstill: **A1 is the press stop trigger point.**

Point B1, located approximately 10° after TDC, constitutes the end of cam 1: **If B1 is exceeded during stopping, the overtravel is abnormally long, the press locks up and the next cycle is inhibited.**

Point A2 of cam 2 functions like point A1 on cam 1 (contact state of the UN limit switch reversed in relation to the state of the OTS limit switch).

Point C2, located approximately 150° after TDC, corresponds to the 8 mm tool closing dimension. Stop instructions issued after C2 is reached are not executed until point A2 is reached.
